

Modification 453 algorithm – future changes

- Recent industry meetings have discussed the intention for algorithm currently developed for Modification 453, to be replaced with a new algorithm at some point after the settlement modification has been implemented.
- There has been some confusion regarding the governance of the algorithm and how this governance may constrain the ease with which a new algorithm can be applied within UK Link systems.
- Xoserve proposes introducing additional text to the Settlement BRD to place a requirement on the need for ease of change of the algorithm. This requirement will then be taken forward to the design stage.
- This therefore removes any linkage between algorithm governance and future change.

Modification 453 algorithm – future change, impacted BRD sections

- The BRD sections impacted include:
 - Section 2 Exec summary
 - Section 3 Design considerations
 - Section 5.3 Estimation Methodology for GFD+1 Allocation
- Xoserve will make the updates to the BRD and submit to PNUNC for approval.
