Allowed Revenue, presentation for DNCMF

Robert Wigginton

Objectives

Provide an overview/recap of how Network price control is set under RIIO to deliver a safe reliable flow of gas.

- **How is allowed revenue calculated**
- **How is revenue recovered**

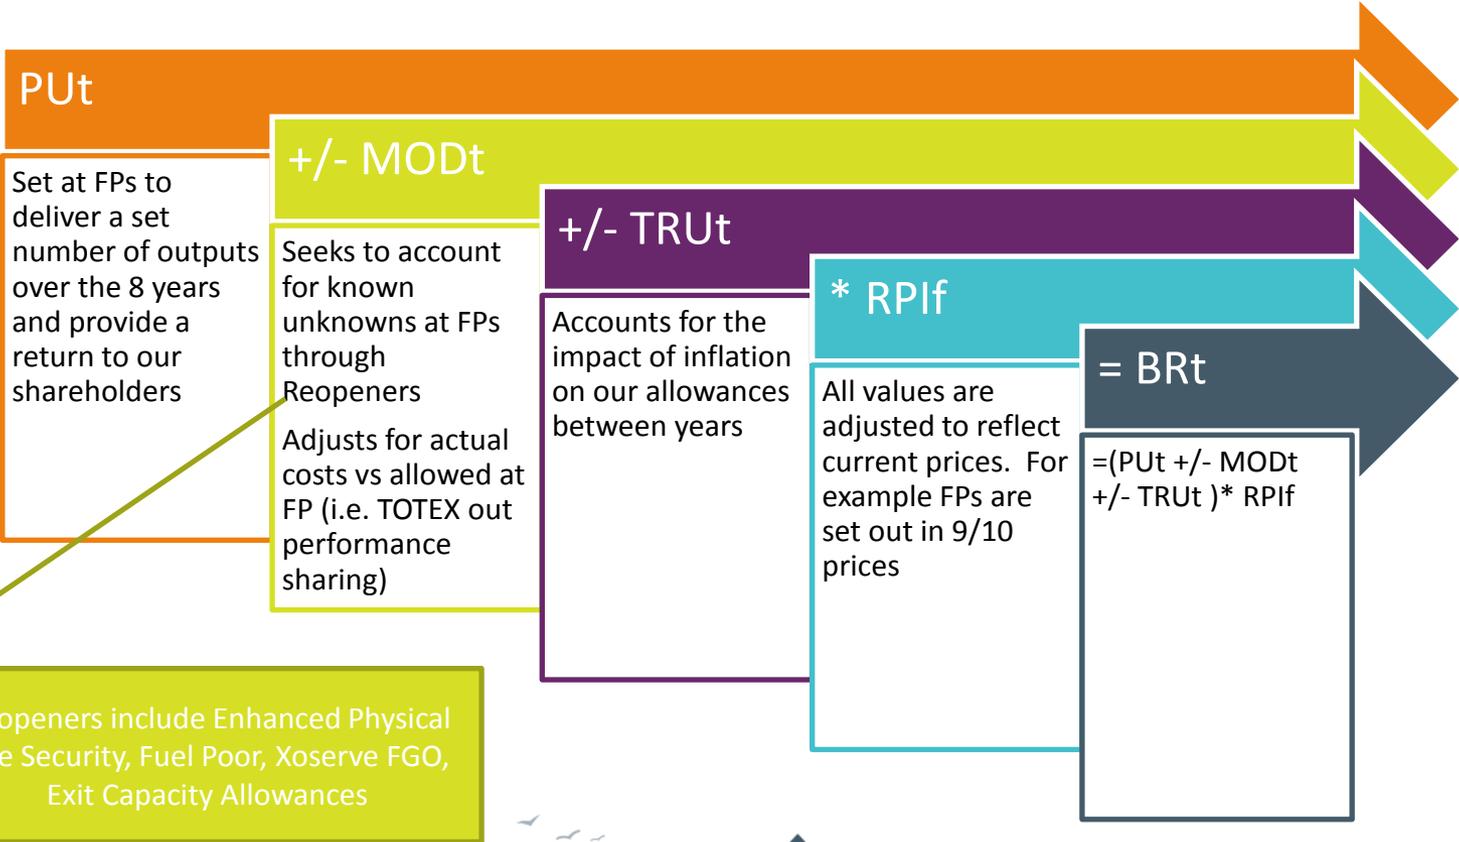

Price Controlled Revenues

Ofgem's regulation of us, as a regional monopoly in the GD1 Price Control utilises the framework 'RIIO':

	Description	How it impacts our Allowed Revenue to incur efficient costs
R	REVENUE	Forecast Allowed Revenue under two distinct 'pots' – Transportation and Exit Capacity
I	INCENTIVES	Opportunities in our licence to benefit from strong performance or be penalised for poor performance
I	INNOVATION	Opportunities in our licence to invest in new and innovative technologies for the long term benefit of consumers
O	OUTPUTS	Our revenue starts off considering the efficient base allowance to deliver the outputs set out in Final Proposals. Consumers benefit when controllable spend comes below this allowance. Networks are to an extent protected from those costs which are considered outside our control (pass through)

Base Revenue

Pass through costs

Costs we are held whole on (when taking one year with another)

Badged under term Pass Through (Pt)

Cost True Up

Licence fee

Business Rates

Legacy Pension (NTS)

Misc.

Shrinkage

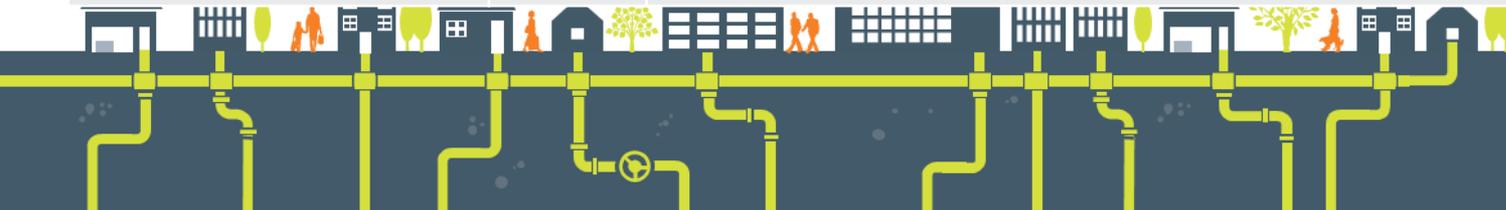

Exit Capacity

2 year cash flow exposure/ protection

Incentives – payment by results!

Incentive	Term	What is it
Broad Measure of Customer Satisfaction Revenue Adjustment	BM_t	Relates to Customer Satisfaction. Includes a penalty for poor performance. Includes incentive for strong Stakeholder performance. Linked to Base Revenue
Environmental Emissions Incentive Rev Adjustment	EEI_t	We benefit from lower Leakage than planned. For example by accelerating the highest risk mains replacement
Discretionary Reward Scheme Rev Adjustment	DRS_t	Awarded every other year. At the discretion of Ofgem following a submitted business case of what the network has done over and above its statutory obligations.
Network Innovation Allowance Rev Adjustment	NIA_t	Ofgem understand that new technology may benefit the consumer therefore sought to meet 90% of the costs of innovation up to a cap of 0.5%*BR with max 25% Internal spend
Shrinkage Incentive Adjustment	SHRR_t	Similar to EEI _t but for the wider measure of Shrinkage.
Exit Capacity Allowance Adjustment	ExC_t	Ofgem provided for required flat capacity bookings to operate the network in a 1:20 at FPs. If we book less than this due to better management we gain by the reduction * the indicative price at T-3 from NTS.

How do we know how to calculate these?

Our Licence includes the basis of calculation for each term.

For example for Exit Capacity Eit

$$EI_t = \frac{IQI}{1 - CT_t} \times [EIT_t - EDC_t] \quad \text{Where:}$$

$$EIT_t = \frac{\sum_{\text{all } v} \left[\left(\sum_{1 \text{ Oct} - 31 \text{ Mar}} NTSIC h_{v,t,d} \times NTSTVE_{v,t} \right) \times \frac{Y_t}{P_t} \right]}{100}$$

$$EDC_t = \frac{\sum_{\text{all } v} \left[\left(\sum_{1 \text{ Oct} - 31 \text{ Mar}} NTSIC h_{v,t,d} \times NTSMAE_{v,t} \right) \times \frac{Y_t}{P_t} \right]}{100} + NTSOC_t - NTSBB_t$$

Exit Capacity

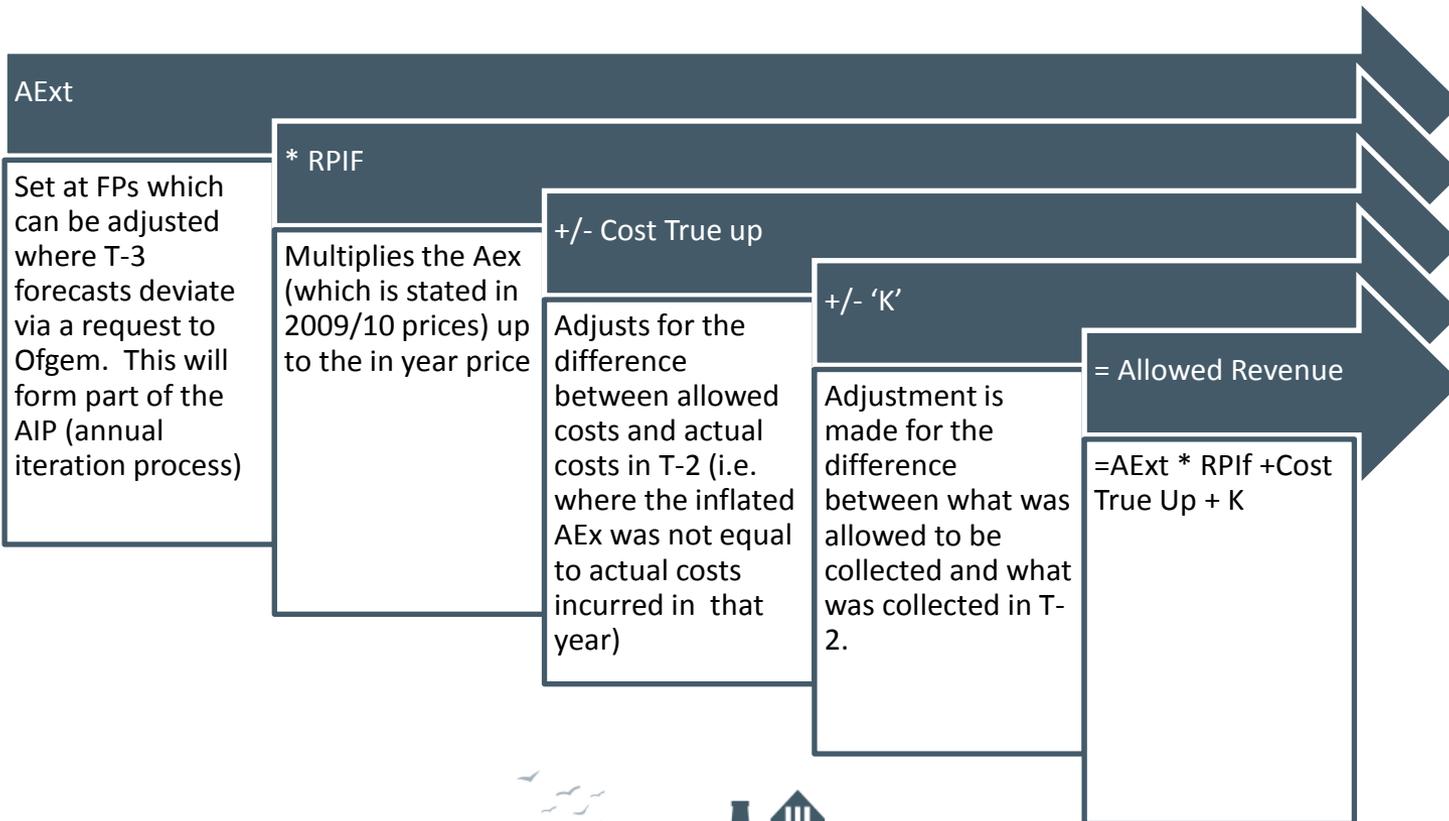

From RIIO GD1 Networks gained an agency relationship to NTS (Previously NTS billed shippers directly). We incur the cost of NTS Exit Capacity and charge our end customers a charge that seeks to recover that cost. It has a similar approach to calculating allowed revenue.

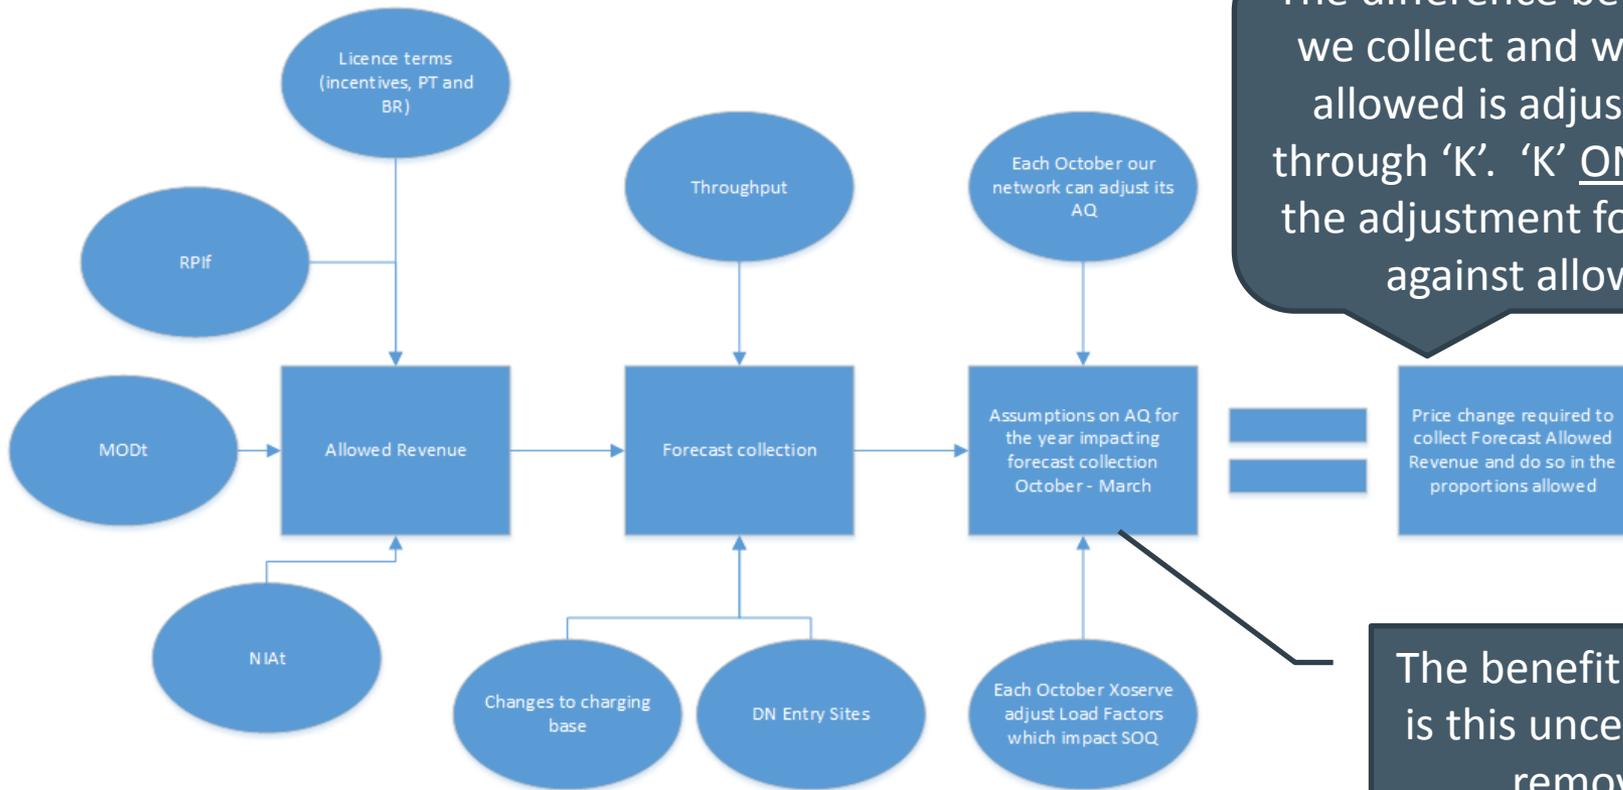

-  Terminal
-  LDZ boundary
-  Existing pipeline (with distance marker)
-  900 Pipeline diameter (mm)
-  (17) Length (km)
-  a Denotes a crossing point between LDZs
-  Proposed pipeline
-  Offtake
-  Storage facility
-  Existing compressor
-  New compressor or compressor modifications
-  Alternative route
-  Upgrading of pipelines
-  Approved emissions projects

Exit Capacity

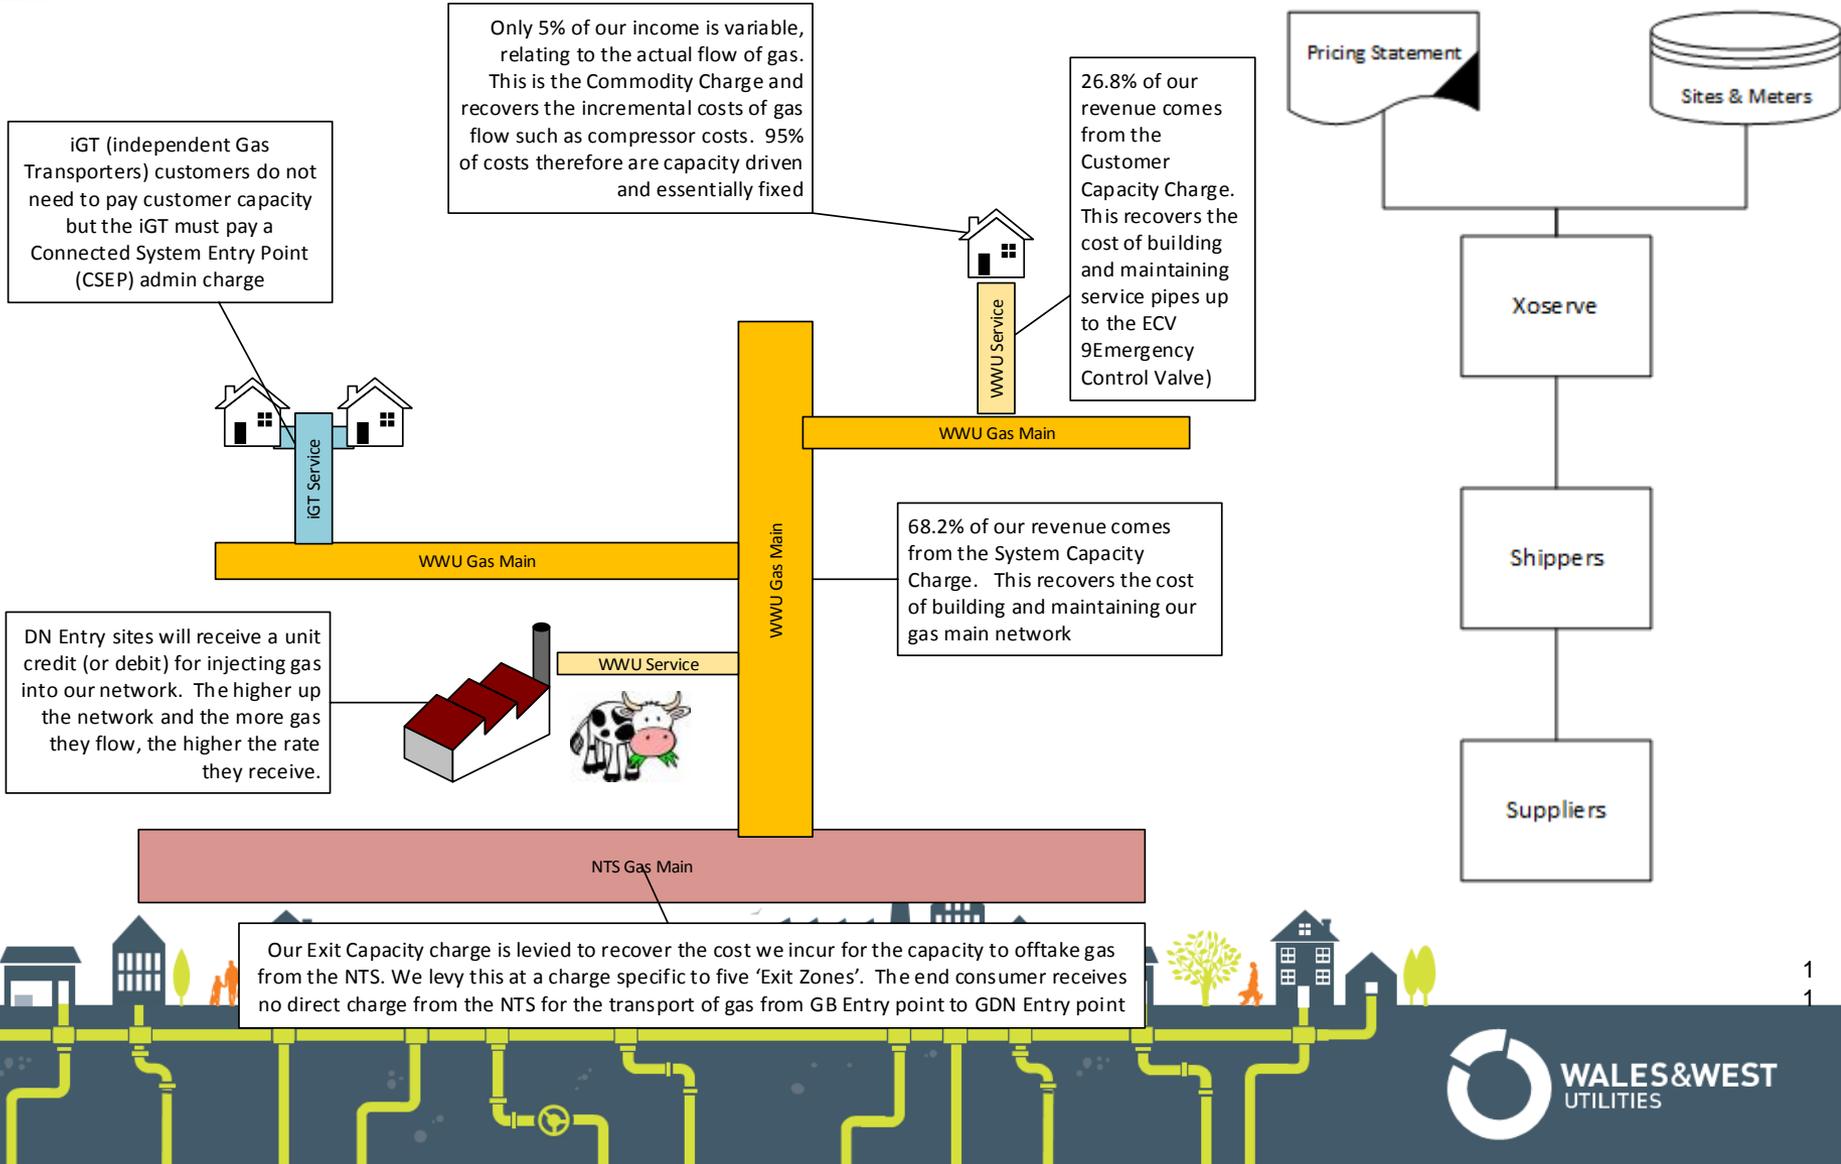

How do we set the price?

The benefit of Nexus is this uncertainty is removed

How do we collect our Income (simplified)
