# Project Nexus Workgroup Meter Read Validation

18<sup>th</sup> February 2015

# Background

---

- The meter read validation principles were developed under ‘The Settlement’ BRD and formed part of Modification 0432.
- Concerns have been raised that the read validation tolerances may not be appropriate, particularly for Smaller Supply Points
- Analysis has been carried out by both British Gas and e-on on the tolerances proposed which has highlighted some issues with the current proposed tolerances
- As a result of this analysis Xoserve have carried out further analysis on both NDM and DM Supply Meter Points
- Agreement gained at the December PN UNC on the bandings and tolerances
- Request at February 2015 PN UNC if further AQ Bands could be added

# Impact of Changing the Validation

---

- The validations were developed at PN UNC using a % of the AQ / SOQ to validate the read
- Recommendation that for Meter Points with an AQ of less than 20,000 kWh the validation should be based on kWh not % of the AQ / SOQ
- This will require a change request as this is a change in the design
  - changing the % values and the AQ bandings does not impact design as these were always a parameterised value
- UKLink Programme have carried out an impact assessment on the impact this change will have to design & testing
- The outcome is the change CAN NOT be delivered for Go Live
- This change will need to be implemented into a later release if still required

# Additional AQ Bands

---

- Requested at February 2015 PN UNC if additional AQ bands could be included and delivered for 1<sup>st</sup> October
- Xoserve can confirm that further AQ Bands can be included
